

Thank you for your patronage!

Please direct all updates, questions, or otherwise to me directly, and I'll try my best to implement or answer them.

- Benjatator

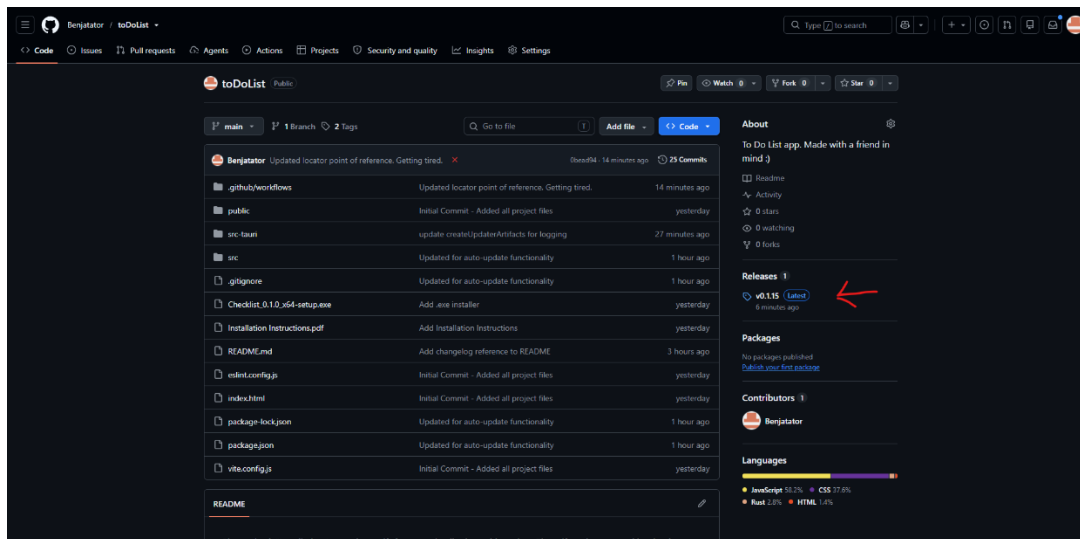

Installation:

Okay, so. This works like a normal windows installation. You can access the files here:

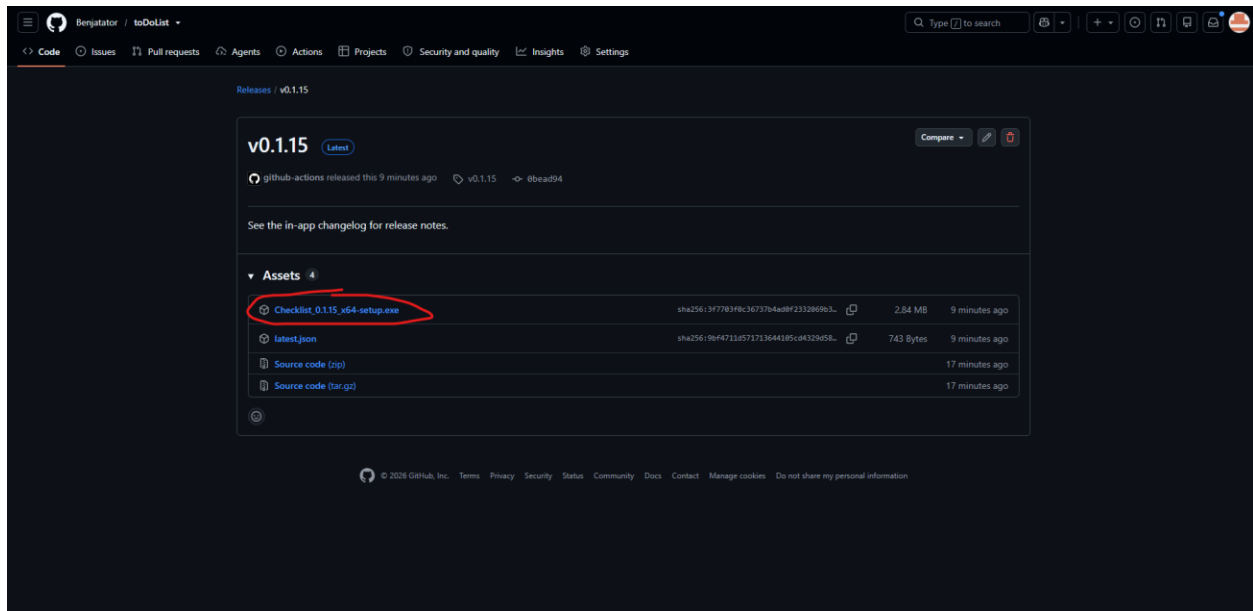

<https://github.com/Benjatator/toDoList/tree/main>

I know it's a GitHub link, but don't worry, I'm going to walk you through the whole installation.

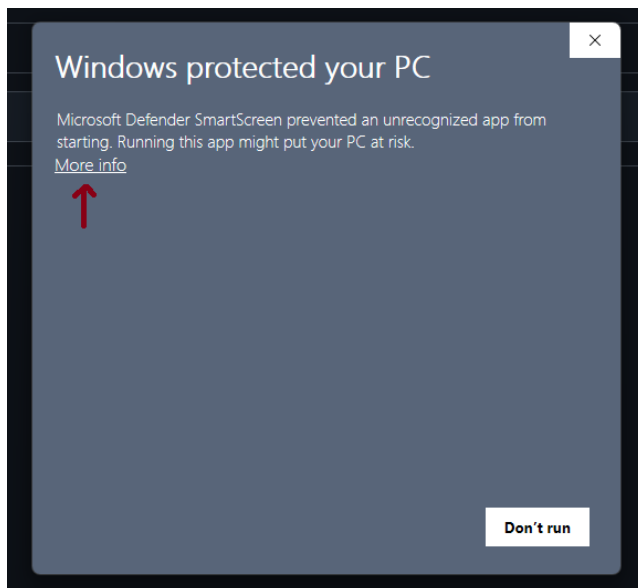

First, under the 'releases' section, you're going to click on whichever file in that list has a 'latest' attached to it:

Next, you'll want to download the file itself by clicking on the .exe file button:

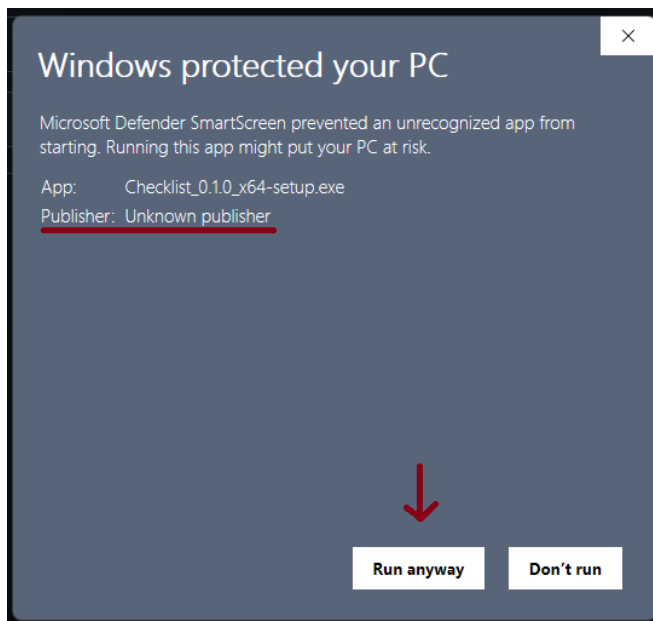

That will download the actual installer into your downloads folder. From here, go to your downloads and run the installer like any other application you download. When you run it, you'll get this popup:

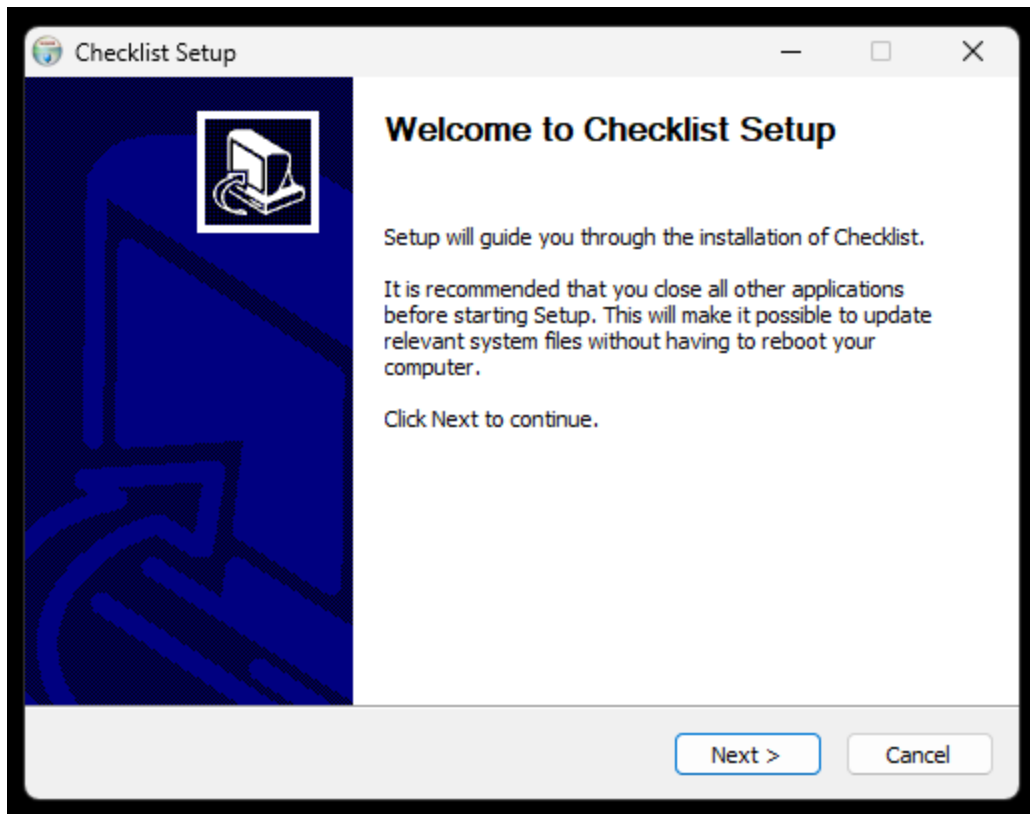

I promise this isn't malware. Windows just has a convoluted way for me to become "recognized" and I didn't want to deal with it since I'm making this with the intention of maybe 3 people actually using it.

Basically, apps normally have a 'digital signature' (literally the name of it) to verify the creator as someone who is trustworthy, and this app got flagged because there is no signature (I didn't bother to put one in there).

Regardless, you can press the "More Info" button highlighted above, then the "Run anyway":

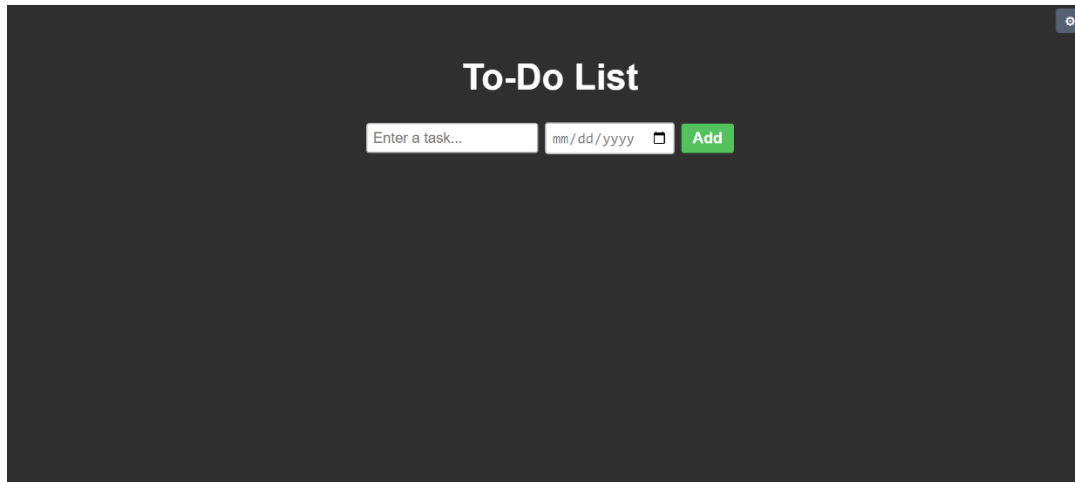

This will take you to a normal installer:

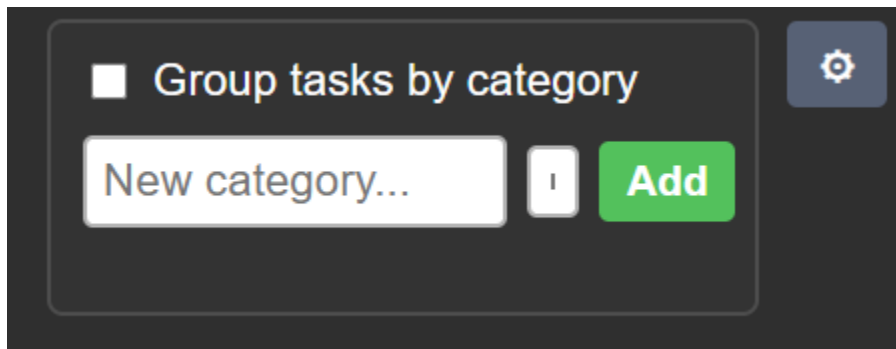

I didn't really name anything well, but that can change in the future. All of the default options should be fine. Then, you should be able to just run the program from your start menu, or the desktop icon if you chose to create one. I'll also try to add pictures later to make it more identifiable.

Usage:

This should be the main page of the app:

From here, you can enter tasks and set their due dates using the buttons in the middle. There's also a settings panel in the top right:

Using this, you can create "categories" for the tasks. The middle button (between name and add) is a color picker, allowing you to color your categories. When categories are enabled, tasks added will have a color coded "pill" showing their category:

To-Do List

中間試験 JAPN 41103 - Due: Aug 24

Project Update DASC 46104 - Due: Aug 27

When “Group tasks by category” is enabled, it instead creates headers that will separate all tasks out into their categories, with uncategorized tasks appearing in their own group:

To-Do List

JAPN 41103

中間試験 - Due: Aug 24

DASC 46104

Project Update - Due: Aug 27

Otherwise:

The application should have local memory, meaning if you close the app and open it once again, it should maintain your list of tasks and display them to you upon launching.

Finally, the tasks (regardless of categorization) are automatically sorted by due date (with dateless tasks moving to the bottom).
